RESPONDENTS' EXHIBIT NO. 65

DESCRIPTION OF PRODUCTION AND DISTRIBUTION FACILITIES OF NEES SYSTEM GAS COMPANIES

CENTRAL MASSACHUSETTS GAS COMPANY

The Central Massachusetts Gas Company franchise area and gas properties are divided into two operating districts, each supplied separately from the Tennessee Gas Transmission Company's system and otherwise isolated from each other.

The main system, the Southbridge-Webster division, receives natural gas in Southbridge at Sandersdale at a point on the high pressure line connecting Southbridge with Webster. At this point, in addition to the take station, there is located a high pressure L.P. Air gas plant with a capacity of 100 MCF per hour or 2400 MCF per day of 1000 Btu equivalent gas at 75 psig, and 50,000 gallons of propane storage. During peak-shaving periods this plant normally produces L.P. Air gas which is mixed with the incoming natural gas and distributed directly through a high pressure line west to Southbridge and east to Webster for local distribution from those centers. Normal peakshaving operation is limited to a 50% mixture of L.P. Air gas with natural gas by the interchangeability characterictics of the two gases. Full propane storage is equivalent to 4600 MCF of 1000 Btu equivalent gas. Under emergency conditions or complete failure of the natural gas supply, the L.P. Air gas plant plus the holders at Southbridge and Webster, could carry the entire load on all but four days of the winter of 1959-1960, and on those days, interruption of industrial customers and reducing temperature

settings of heating customers' thermostats would make it possible to carry the entire remaining load on all days.

There are no production facilities in Spencer and no connections between the two divisions. Accordingly, the Spencer Division area is entirely dependent on pipeline gas.

In the Webster-Southbridge division, the incoming natural gas flows in two directions to the holder station at Union Street, Webster, and the holder station at Wardwell Court, Southbridge. The high pressure feeder main connecting the two holder stations is composed of 4-inch, 6-inch and 8-inch diameter pipe. The gas which flows into Southbridge is reduced in pressure at the holder station and routed to the low pressure system. There is one high pressure feeder main. The gas which flows toward Webster supplies a high pressure distribution area in Dudley and the holder station in Webster. At the Webster holder station, the gas is reduced in pressure and routed into the holder from which it flows through a station governor into the low pressure network in Webster and part of Dudley. The low pressure systems of the Webster-Southbridge division operate at 6.0 inches water column.

In the Spencer division, the incoming natural gas flows from the receiving station through an 8 inch diameter high pressure feeder main which connects to the high pressure feeder mains supplying the holder station at Spencer and the high pressure distribution systems in the communities of Brookfield, East Brookfield, North Brookfield, West Brookfield, Leicester, Spencer and Warren. At the holder station in Spencer, the gas is reduced in pressure and routed to the intermediate pressure distribution network in Spencer. All of the customers in the Spencer division are served through house service pressure regulators from high or intermediate pressure mains.

The Central Massachusetts Gas Company has 13.6 miles of cast iron mains, 34.0 miles of welded steel mains and 93.7 miles of wrought iron or steel mains with screwed or mechanical joint connections. The total of 141.3 miles of mains include 70.6 miles of principal high pressure feeder mains which range in diameter from 3/4 to 8 inches. 46 per cent of the mains are 4 inch or larger in diameter.

LAWRENCE GAS COMPANY

The production facilities of the Lawrence Gas Company are located off Marston Street, Lawrence, consisting of a high Btu oil gas plant, and a low pressure L.P. Air gas plant. The oil gas plant contains one production unit, two light oil generators, one 9 feet in diameter, one 8 feet in diameter with an 8 foot diameter superheater. This machine is capable of producing 110 MCFH of 1000 Btu equivalent gas or 2200 MCF per day. Fuel storage for oil gas production consists of 180,000 gallons, equivalent to about 12,000 MCF of 1000 Btu equivalent gas. The low pressure L.P. Air gas plant is a jet plant with a maximum production capacity of 200 MCFH of equivalent 1000 Btu gas or 4800 MCF per day. Fuel storage for L.P. Air gas production consists of 75,000 gallons of propane equivalent to 6900 MCF of 1000 Btu equivalent gas.

Oil gas and L.P. Air gas, as required, are produced and stored in a low pressure storage holder. From there they are pumped to higher pressures for mixing with natural gas for sendout to the medium pressure distribution system. Mixed gas also flows into the low pressure holders through a pressure regulator for plant distribution to the local area of Lawrence. The production plants are used primarily for peak-shaving and also they provide backup for the natural gas supply. When used for peak-shaving, oil gas cannot be used for more than 40% of the sendout, and L.P. Air gas is not used for more than 50%. When both oil gas and L.P. Air gas are used, the mixture is limited to 60% of the sendout.

Tennessee Gas Transmission Company delivers gas to the Lawrence Gas Company at a take point in Methuen, Massachusetts. From this point, part of the gas is delivered westerly to a pressure regulator station at Jackson and East Streets, Methuen, supplying the low pressure distribution system. The bulk of the gas purchased flows from Oak Street to the Marston Street plant in Lawrence, the main distribution center of the Company. From the main distribution center, low pressure and feeder mains extend into Lawrence, Methuen, Andover and North Andover.

Customers are served from low pressure mains operating at 6-inch water pressure and intermediate pressure mains operating at from 20-inch water pressure to 2 psig. About 2.5% of the customers are served through individual house pressure regulators. The Lawrence distribution system consists of approximately 253.5 miles of cast iron mains, 22.5 miles of welded steel mains, and 25.7 miles of wrought iron and steel mains with threaded or mechanical joints. Included in this mileage are the principal high pressure feeder mains which total about 14.5 miles ranging from 6 inches to 12 inches in diameter. Approximately 86% of the mains in the Lawrence distribution system are 4 inches or larger in diameter.

LYNN GAS COMPANY

The production plant of the Lynn Gas Company is located on the Lynnway in Lynn, and consists of three production units; one 12'6" and two 10'6" inverted "U" type high Btu oil gas sets. Only two of these sets can be operated simultaneously, the larger set with one of the smaller sets, due to the fact that the two smaller sets have a common air blower. This plant can produce a maximum of 390 MCFH of 1000 Btu equivalent gas or 7800 MCF per day. Fuel storage for oil gas production consists of 4,555,000 gallons of oil storage, which is equivalent to 304,000 MCF of 1000

Btu equivalent gas. This is adequate for about 39 days of capacity production. Lynn has excess oil storage capacity which could be beneficially used by the North Shore Gas Company and/or Mystic Valley Gas Company.

High Btu oil gas as produced is put into the 2000 MCF and 5000 MCF storage holders where it is mixed with natural gas in the holders. Peak-shaving is accomplished by delivery of this mixed gas directly to the local low pressure system or by supplying this mixed gas from these storage holders through gas compressors to the high pressure feeder main system.

Lynn Gas Company has no boiler plant of its own and purchases all of its steam requirements from the adjacent plant of the Lynn Electric Company.

Lynn purchases all of its natural gas requirements from the Tennessee Gas Transmission Company through the receiving station at Homesite Street, Lynn, Massachusetts. From this station the natural gas purchased is delivered to the distribution and control center located at the gas plant on the Lynnway through a primary 12 inch high pressure feeder main. At the Lynnway distribution center the incoming natural gas is delivered through a pressure regulator to the storage holders and thence through another pressure regulator to the local low pressure distribution center. Also at this distribution center, the incoming natural gas is routed to high pressure feeder mains which extend into Lynn, Swampscott, Marblehead, Saugus, Lynnfield and Nahant.

Customers are served generally from a low pressure distribution system in which the operating pressure is 6.0 inches water. The high pressure feeder main system operating at pressures of 20 to 45 psig supplies and reinforces the pressure in the low pressure system through pressure regulators connecting the two systems at necessary locations. About 7% of the customers are supplied directly

from the high pressure feeder system through house service pressure regulators.

The Lynn distribution system consists of 245 miles of cast iron main, 81 miles of welded steel main, and 42 miles of wrought iron or steel main with threaded or mechanical joints all ranging in diameter from 1 inch to 24 inches. Included in this mileage are the principal high pressure feeder mains which total about 31% miles and which range in diameter from 4 inches to 12 inches. Approximately 82% of the mains in Lynn's distribution system are 4 inch or larger in diameter.

MYSTIC VALLEY GAS COMPANY

The Mystic Valley Gas Company has three gas plants: a high Btu oil gas plant and a low pressure L.P. Air gas plant at Charles Street, Malden, and a high pressure L.P. Air gas plant at John Street, Reading. The Malden oil gas plant contains three production units, two 111/2 foot sets and one 11 foot set. These are all twin generator light gas oil sets. This plant can produce a maximum of 590 MCFH of 1000 Btu equivalent gas or 11,800 MCF per day. Fael storage for oil gas production consists of 900,000 gallons of oil storage, which is equivalent to 60,000 MCF of 1000 Btu equivalent gas. The low pressure L.P. Air gas plant at Malden is a jet plant with a maximum production capacity of 420 MCFH of 1000 Btu equivalent gas or a daily capacity of 10,080 MCF. Fuel storage for L.P. Air production consists of 225,000 gallons of propane which is equivalent to 20,700 MCF of 1000 Btu equivalent gas.

Gas produced by both the oil gas plant and the L.P. Air gas plant at Malden is put into a 1000 MCF storage holder at the plant. From there it is compressed and delivered to the plant control center where it is mixed for peak-shaving purposes with high pressure natural gas from the Arlington receiving station before routing into the high pressure

distribution feeder main system and through a pressure regulator into the low pressure distribution network.

The high pressure L.P. Air gas plant at John Street, Reading, can produce a maximum of 420 MCFH of 1000 Btu equivalent gas at 50 psig or 10,080 MCF per day. Fuel storage for L.P. Air production consists of 150,000 gallons of propane which is equivalent to 13,800 MCF of 1000 Btu equivalent gas. This gas, as produced, can be mixed for peak-shaving purposes with high pressure natural gas from the Reading receiving station. The mixed gas is then delived to the high pressure feeder main system; north to Reading and south to the main distribution system of the Mystic Valley Gas Company.

Under normal operating conditions, mixed produced gas and natural gas cannot be delivered to the Arlington area and can only be delivered to a very small part of the Revere area. Because of this situation, peak-shaving in the Mystic Valley Gas Company is limited to about 53% of its distribution area and load.

Mystic Valley purchases gas from Tennessee Gas Transmission Company at four receiving stations. These stations are located on the periphery of the distribution system at Washington Street, Arlington, at Wood Street, Lexington, at Lowell Street, Reading, and at Broadway, Malden. There are three major distribution centers or stations and two minor stations in the Mystic Valley Gas Company. The major centers are at Grove Street, Arlington, Railroad Avenue, Revere, and Charles Street, Malden. The two minor stations are at John Street, Reading, and Wood Street, Lexington. Normally gas flows from the Arlington station through a 16 inch high pressure primary feeder to a regulating and holder station at Arlington, at which point part of the gas is routed through secondary high pressure feeder mains to the communities of Arlington, Belmont, Burlington, Lexington, Winchester and Woburn. The remainder

of the gas from the Arlington station continues to flow through the 16 inch high pressure primary feeder until it reaches the Malden gas plant at which point the gas is routed through secondary high pressure feeder mains toward the communities of Medford, Malden, Everett, Revere, Melrose, Stoneham, Wakefield and Reading. At the Malden gas plant, peak-shaving is performed by adding propane-air and/or oil gas to the natural gas. During the summer months, gas flows from the Lexington station into the distribution system owned by the Air Force at Hanscom Air Base in Bedford. During the winter months the gas consumption at the air base is substantially reduced and, in order to maintain a favorable purchased gas load factor at each take point, the Mystic Valley Gas Company routes through an 8 inch high pressure primary feeder and several secondary high pressure feeders, a quantity of gas into the area normally supplied from the Arlington receiving station. The control of volume flow during the winter months from the Lexington station is accomplished by means of a remote control device which is monitored by personnel at the Malden control center.

Gas which is received at the Reading station travels through a 10 inch high pressure primary feeder to the L.P. Air gas plant and regulating station at Reading. From this point the gas is routed, through secondary high pressure feeder mains, toward the communities of Reading, Stoneham, Melrose, Wakefield, Malden and Revere. When required for peak-shaving, propane air gas is added to the natural gas at the Reading plant.

The receiving station located in Malden adjacent to the Revere boundary, delivers gas through a 12-inch primary high pressure feeder main and several secondary high pressure feeder mains. The gas flows into the communities of Revere and Winthrop partly by way of regulators con-

nected to the 12-inch primary feeder and partly by way of regulators located at the holder station at Revere.

Monitoring of gas pressure and flow conditions is performed by the telemetering of various information from selected locations. For example, the height of outlying holders in Arlington, Revere and Winchester can be determined by observation of telemetered information in the control center. The flow into the holders can be regulated by personnel at the Malden control center via remote control facilities.

The Mystic Valley Gas Company has approximately 79,300 customer services, some of which supply more than one customer through separate meters. There are approximately 5100 house service regulators in use to control the pressure delivered to appliances wherever the distribution main pressure is greater than normal low pressure. The pressure in the high pressure mains ranges from about 2 psig to about 90 psig depending on the time of year, the particular main considered and customer requirements. The high pressure mains range in diameter from 3/4 inch to 20 inches. The low pressure system is supplied from holders and/or regulator stations which receive their supply from high pressure feeder mains. The low pressure system operates at an average pressure of approximately 6 inches water column. Low pressure mains range in diameter from 1 inch to 30 inches. In the Mystic Valley area there are approximately 710 miles of east iron mains, . 106 miles of welded steel mains and 100 miles of wrought iron or steel mains with the latter having other than welded joint construction.

NORTH SHORE GAS COMPANY

The production facilities of the North Shore Gas Company are a high Btu oil gas and a low pressure L.P. Air gas plant on Pierce Avenue, Salem, a high pressure L.P.

Air gas plant in Danvers and an L.P. Air gas plant on Emerson Avenue, Gloucester.

The Pierce Avenue plant in Salem contains two high Btu oil gas machines, 11 feet and 9 feet in diameter and can produce a maximum of 283 MCFH or 5650 MCF per day of 1000 Btu equivalent gas. Oil storage for high Btu oil gas production amounts to 230,000 gallons equivalent to 15,320 MCF of 1000 Btu equivalent gas or 2.71 days at the maximum production rate. Also located at the Pierce Avenue plant in Salem is a low pressure jet mixing type L.P. Air gas plant with 50,000 gallons of propane storage. This plant can produce a maximum of 216 MCF per hour of 1000 Btu equivalent gas and on the same basis can produce 5185 MCF of 1000 Btu equivalent gas per day. The propane storage is equivalent to 4600 MCF of 1000 Btu equivalent gas.

At the Pierce Avenue plant high Btu oil gas and/or L.P. Air gas is produced and delivered directly into the 500 MCF storage holder. Compressors take the gas from this storage holder and deliver it to a high pressure mixing house where it is mixed with natural gas for high pressure distribution. The mixed gas then goes out to the high pressure system or through a pressure regulator to the 2000 MCF holder for low pressure distribution. Mixed gas from the 2000 MCF holder is also delivered to the River Street holder station, Beverly, for low pressure distribution in the Beverly area.

The high pressure L.P. Air gas plant at Danvers can produce a maximum volume of 360 MCF per hour of 1000 Btu equivalent gas at 75 psig, and on the same basis can produce 8640 MCF of gas per day. The propane storage is equivalent to 6900 MCF of 1000 Btu equivalent gas. Under normal peak-shaving operation, L.P. Air gas is produced at this plant and mixed directly with natural gas being delivered by the Tennessee Gas Transmission Com-

pany, and sent out at high pressure on the main take lines delivering gas to the Beverly side of the distribution system and directly south to Peabody and the Salem distribution center at the Salem plant at Pierce Avenue.

Under emergency operation or the failure of gas supply from the pipeline, the Pierce Avenue plant would produce L.P. Air gas and oil gas and the Danvers L.P. Air gas plant would produce L.P. Air gas at high pressure. In this way, the entire load of this Division of the North Shore Gas Company could be produced. Under normal peakshaving operations, the high Btu oil gas plant at Pierce Avenue is used. While 40% is considered to be a critical limit of produced gas in the sendout gas in this territory, there are five industrial plants manufacturing lamp bulbs or other similar products which have a very critical tolerance to mixed gas. Since high Btu oil gas has the least effect on industrial applications, it is given preference in peak-shaving.

In the Gloucester division of the North Shore Gas Company, Tennessee Gas Transmission Company delivers gas at a receiving station at Essex Avenue. From there it is delivered by a high pressure line to the main part of Gloucester across the Annisquam River. On the west side of the River there are only a few domestic and commercial customers and one large industrial. At the Emerson Avenue distribution center is a Hortonsphere high pressure gas holder with an effective capacity of 190 MCF. Also located here is a high pressure L.P. Air gas plant with a maximum capacity of 137 MCF per hour of 1000 Btu equivalent gas, or 3288 MCF of 1000 Btu equivalent gas per day. The L.P. storage at this plant consists of 50,000 gallons of propane equivalent to 4600 MCF of 1000 Btu equivalent gas.

Under emergency operation such as complete failure of pipeline gas the Emerson Avenue L.P. Air gas plant and the Hortonsphere could supply the entire requirements of the Gloucester division. Under normal peak-shaving operation, the loads west of the Annisquam River cannot be supplied with manufactured gas. Natural gas from the pipeline and L.P. Air gas are mixed and distributed to the low pressure system through pressure regulators and to the intermediate pressure system for local distribution in Gloucester east of the River.

The North Shore Gas Company purchases all of its natural gas requirements from the Tennessee Gas Transmission Company through two receiving stations; one in the Gloucester division at Essex Avenue, Gloucester, and one in the Salem-Beverly division at Broad Street, Danvers. These two divisions of the North Shore Gas Company have completely separate distribution systems, with no interconnecting mains between divisions.

In the Gloucester division, the incoming natural gas is transported from the receiving station to the L.P. Air gas plant at Emerson Avenue, through an 8 inch diameter primary high pressure feeder main. The incoming gas pressure is reduced at this point and routed through high pressure feeder mains which extend into the communities of Gloucester and Rockport.

Most of the customers are served from a low pressure distribution system in which the operating pressure is 6.0 inches water column. The high and intermediate pressure feeder main system operating at pressures of from 1 psig to 50 psig reinforces the pressure in the low pressure system through pressure regulators connecting the two systems at necessary locations. About 15 per cent of the customers are supplied from the intermediate and high pressure system through house service pressure regulators.

In the Salem-Beverly division, the incoming gas is transported from the receiving station and L.P. Air gas plant at Broad Street, Danvers, to the Salem gas plant at Pierce Avenue, Salem, through a 12-inch diameter primary high

pressure feeder main; and to a connection in Danvers to the high pressure peripheral feeder system through a 12-inch diameter primary high pressure feeder main. At the Pierce Avenue plant, the gas is reduced in pressure and routed to the high pressure peripheral feeder to the holders in Salem and Beverly and to the low pressure systems in Salem, Peabody and Beverly.

The high pressure peripheral feeder forms a loop which extends from the holder station located at River Street, Beverly, through parts of Beverly, Danvers, Peabody and Salem, to the gas plant at Pierce Avenue, Salem. There are high pressure feeder branches from the loop main and connections where the low pressure system is reinforced through pressure regulators. About 4 per cent of the customers in the Salem-Peabody division are served through house service regulators from high pressure distribution mains. The remainder of the customers are supplied from the low pressure systems.

The North Shore Gas Company has approximately 347 miles of mains ranging from 1½ inches to 16 inches in diameter, consisting of 247 miles of cast iron mains, 62 miles of welded steel mains and 38 miles of wrought iron or steel mains with screwed or mechanical joint connections. Included in this total mileage are the principal high pressure feeders which are about 58 miles in total length and which range from 2 inches to 12 inches in diameter. Approximately 85 per cent of the mains in the North Shore Gas Company's distribution system are 4 inches or larger in diameter.

NORTHAMPTON GAS LIGHT COMPANY

This company supplies gas to the City of Northampton and the Town of Easthampton. Natural gas is purchased from the Tennessee Gas Transmission Company at the Earl Street delivery point from which gas for Northampton

flows to the Crafts Avenue production plant to the West Street holder station, the distribution center for low pressure delivery. At the Crafts Avenue plant there is an oil gas plant containing one high Btu oil gas machine capable of producing 55 MCF per hour or 1100 MCF per day. Oil gas produced at the Crafts Avenue plant is mixed with natural gas and distributed by compressors to the intermediate pressure system extending north to Florence and Leeds and also is sent to the low pressure holder at West Street for low pressure distribution. Gas for Easthampton is transmitted at high pressure from the Earl Street gate station and cannot be peak shaved. Approximately 60% of the total Northampton Gas Light Company load can be peak shaved.

Northampton plans to install an L.P. Air gas plant at the Earl Street delivery point this year. Following that the oil gas plant at Crafts Avenue will be abandoned. This will make it possible to peak shave the entire Northampton

system.

Gas for Easthampton flows from the Earl Street delivery point through a high pressure feeder main which is partly 8 inches and partly 4 inches in diameter to the Easthampton distribution system and to the Easthampton holder station at Liberty and Mechanic Streets. A district regulator between the feeder main and the low pressure system provides pressure reinforcement. At the holder station in Easthampton the gas is reduced in pressure and routed to the holder, the low pressure network and to an intermediate pressure feeder main which in turn supplies a district regulator for reinforcing the pressure in part of the low pressure system.

The low pressure systems in Easthampton and Northampton operate at a pressure of 6.0 inches water column. Approximately 5 per cent of the customers of the Northampton Gas Light Company are served from high or inter-

mediate pressure mains through house service pressure regulators. The Northampton Gas Light Company has 69.7 miles of cast iron mains, 16.9 miles of welded steel mains and 24.7 miles of wrought iron or steel mains with screwed or mechanical joint connections. The total of 111.3 miles of mains includes 23.4 miles of principal high pressure mains which range in diameter from 2 inches to 8 inches. 60.2 per cent of the total mains are 4 inches in diameter or larger.

NORWOOD GAS COMPANY

The Norwood Gas Company purchases gas from the Algonquin Gas Transmission Company, delivering it to the Dean Street plant of Norwood. At this location Norwood has an L.P. Air gas plant with an hourly rating of 100 MCF of 1000 Btu equivalent gas at 13 psig, or 2400 MCF per day. During normal peak-shaving operations L.P. Air gas is mixed directly with the incoming natural gas and distributed through regulators to the low pressure distribution system of Norwood and directly to the intermediate pressure mains. Norwood has propane storage in the amount of 50,000 gallons equal to 4600 MCF of 1000 Btu equivalent gas.

In the event of complete failure of pipeline gas, the L.P. Air gas plant is presently capable of supplying the entire load of Norwood. During normal peak-shaving operations, a 55% mixture of L.P. Air gas with natural gas is the maximum permitted by interchangeability.

District pressure regulators connecting between the high pressure feeder mains and the low pressure network at necessary locations serve to reinforce the pressure in the low pressure system. The low pressure system operates at 6.0 inches water column. Approximately 11 per cent of the customers of the Norwood Gas Company are supplied from high pressure mains and house service pressure regu-

lators. The Norwood Gas Company has 4.2 miles of cast iron mains, 44.0 miles of welded steel mains and 23.9 miles of wrought iron or steel mains which have screwed or mechanical joint connections. The total of 72.1 miles of mains includes 13.7 miles of principal high pressure feeder mains ranging in diameter from 1½ inches to 8 inches. 69.8 per cent of the total mains are 4 inches in diameter or larger.

WACHUSETT GAS COMPANY

The Wachusett Gas Company consists of two completely separated divisions, the Clinton division and the Leominster division. There is no physical connection between the distribution systems of those two divisions. The Leominster division of the company has an L.P. Air gas plant and storage holder located at Mill Street in Leominster. The L.P. Air gas plant is a high pressure plant with a production capacity of 130 MCF per hour @ 10 psig of 1000 Btu equivalent gas or 3120 MCF per day. Fuel storage for L.P. Air gas production consists of 50,000 gallons of propane storage equal to 4600 MCF of 1000 Btu equivalent gas. L.P. Air gas as produced for peak-shaving is mixed directly with the incoming natural gas and routed to the high pressure feeder system and also through a pressure regulator to the local low pressure distribution system. A 50% mix of L.P. Air gas and natural gas is considered to be the maximum usable mixture during peak-shaving on account of interchangeability problems with appliances. In the event of a complete failure of natural gas supply the capacity of the L.P. Air gas plant is sufficient to carry the entire Leominster division load of Wachusett Gas Company.

The Clinton division of Wachusett Gas Company has no production facilities of any kind. There is at the Pleasant Street holder station a 150 MCF wet seal holder capable of supplying pressure to the low pressure portion of the town

of Clinton, and this with a readily established emergency tie with Worcestter provides backup to this division.

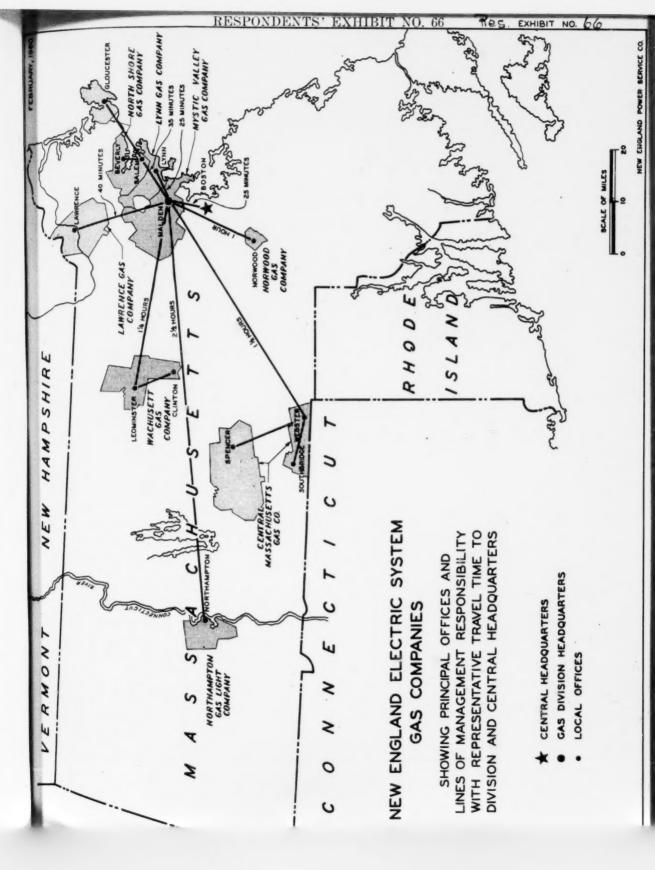

The Wachusettt Gas Company purchases all of its natural gas requirements from Tennessee Gas Transmission Company through two receiving stations; one located at Bishop Street, Leominster, and the other located at Barrett Street, Clinton.

In the Leominster division, the incoming natural gas flows through a 66-inch primary high pressure feeder which leads from the receiving station to the L.P. Aid gas plant at Mill Street, Lecominster. At the gas plant location, the gas is reduced in pressure and routed to the storage holder, the low pressure distribution system and to the high and intermediate præssure feeder mains which extend into Leominster and mart of Lunenburg. Approximately 10 per cent of the customers in the Leominster division are supplied through house service pressure regulators from high or intermediate poressure mains. The remainder of the customers are supplied from low pressure mains in which the pressure is reeinforced by district regulators connected between the high (or intermediate pressure feeder mains and the low pressures mains at necessary locations. The low pressure system coperates at a pressure of 6.0 inches water column.

In the Clinton division, the incoming natural gas flows through a 6-inch primary high pressure feeder main which leads from the receiving station to the holder and regulator station at Pleasant Street, Clinton. At the Pleasant Street location the gas its reduced in pressure and routed to the 150 MCF storage holder, the low pressure distribution network and to a high pressure feeder main which extends into Clinton to ssupply a district regulator station. The district regulator station reinforces the low pressure network supplying Clinton and a very small area of Lancaster.

Less than 1 per cent of the customers in Clinton are served from high pressure mains through house service pressure regulators. Nearly all of the customers receive gas from the low pressure system which operates at a pressure of 6.0 inches water column.

The Wachusett Gas Company has approximately 76.7 miles of cast iron mains, 8.7 miles of welded steel mains and 11.5 miles of wrought iron or steel mains with screwed or mechanical joint connections for a total of 96.9 miles of mains. This latter figure includes 10.1 miles of principal high pressure feeder mains ranging in diameter from 4 inches to 10 inches. Mains which are 4 inches in diameter or larger represent 86.1 per cent of the total length of the distribution system.

NEW ENGLAND ELECTRIC SYSTEM 441 STUART STREET BOSTON 16. MASSACHUSETTS

HARRY MANSON

August 20, 1959

Nr. A. F. Huson, Chief Office of Research and Service Company Regulation Securities and Exchange Commission Room 329 Washington 25, D. C.

Dear Mr. Husons

On Honday when you visited with us, I promised to send you the data set forth belows

- 1. The expenses of New England Electric System (NEES), on a corporate basis, for the year 1953 totaled \$924,234. Of this total, about \$600,000 was for salaries and expenses. Salaries aggregated \$435,000, while expenses (annuity and group insurance premiums, general office rents, traveling expenses, etc.) aggregated about \$165,000.
- 2. Of the \$600,000 for salaries and expenses, it is my opinion that from 30% to 40% would be chargeable to NEES, while the balance would be chargeable to operating subsidiaries. The amount chargeable to subsidiaries would therefore be in the \$350,000 to \$425,000 range. I would expect that a substantial amount of this total would be chargeable to specific work for the operating subsidiaries. However, if it were allocated to the operating subsidiaries on the basis of their weighted gross revenue, the amounts chargeable to each operating company would be as set forth in the following tabulation.

Percentage Allocation	Allocation of \$350,000	Allocation of \$425,000	
2.8%	\$ 9,800	\$ 11,900	,
1.0			
1.9

THE MAME "NEW ENGLAND ELECTRIC SYSTEM" MEANS THE TRUSTEE OR TRUSTEES FOR THE TIME BEING (AS TRUSTEE OR TRUSTEES ME NOT PERSONALLY) UNDER AN AGREENENT AND DECLARATION OF TRUST DATED JANUARY 2, 1926. AS AMENOED, WHICH IS DEFAULD TO, AND A COPY OF WHICH AS AMENOED MADERS TO THE TRUST DATED JANUARY 2, 1926. AS AMENOED, WHICH IS

Company	Percentage Allocation	Allocation of \$350.000	of 45
Northemoton Gas Light Company Northern Berkshire Gas Company Norwood Gas Company Luiney Electric Company Southern Berkshire Power & Electric Company Suburban Electric Company Wachusett Gas Company Waywouth Light and Power Company Worcester County Electric Company	2.7 .5 3.6 1.2 5.6 .8 3.1 13.2	\$ 3,150 9,450 1,750 12,600 4,200 19,600 2,800 10,850 46,200	\$ 3,622 11,47 2,123 15,300 5,100 23,600 3,400 13,17 56,100 \$425,000

2. I also went to confirm what I told you crally on Monday, namely, that this suggested change whereby personnel now on the NEES payroll would be transferred to the payroll of New England Power Service Company and a portion of their compensation and expenses charged to subsidiary operating compenies will not in itself be a reason for seeking a rate increase. As I explained to you, one of the subsidiary operating companics, Weymouth Light and Power Company, filed new rate schedules with the Massachusetts Department of Public Utilities last week which are designed to increase revenue about \$370,000 a year and this is the only rate case now pending. Our later agreements expire the end of this year and it may very well be that higher later coats, higher municipal taxes and other expenses will make it necessary to seek rate increases by some companies, although we have nothing definite in mind at the present time.

Sincerely yours

Res. Exhibit 89

Mr. Samuel Gishman Assistant Chief Financial Analyst Branch of Public Utility Regulation Securities and Exchange Commission Washington 25, D. C.

Dear Mr. Gishman:

This is in answer to your telephone inquiry to Mr. R. B. Dunn concerning (1) an explanation of the difference between the two figures relating to insurance in Exhibit 91 and how the insurance cost was arrived at and (2) additional information as to blanket coverages and allocation of costs with respect to insurance shown in Exhibit 89.

With respect to (1) above, the difference between the figure of \$127,000 shown in paragraph A at the top of page 38 in Exhibit 91 and the \$120,600 in the last column on page 40 represents the amount of insurance savings which would affect other than income accounts in the year 1958. The figure of \$127,000 represents the gross savings in insurance costs which would be realized under combined operation as compared with independent operations (see Exhibit 92).

With respect to (2) above, all of the policies shown in Exhibit 89 were systemwide blanket policies with the exception of the Water Heater Warranty Bond, Legal Liability Gas Explosion, Direct Damage Gas Explosion, and Extra Expense Insurance which were blanket policies for the gas companies only, and a few small policies written for Lynn Gas and Electric Company prior to acquisition still in effect. However, certain of the blanket policies were not applicable to every company since in the case of certain companies no risk or exposure was involved. Of course, in this event no part of the cost was allocated to such companies.

We are attaching a schedule showing the allocation of costs for each of the coverages between gas, electric and other companies, and the basis for allocation.

Sincerely yours

s/ Harry Hanson

HARRY HANSON

June 21, 1960

Mr. Francis H. Spencer Division of Corporate Regulation Securities and Exchange Commission Washington 25, D. C.

Dear Mr. Spencer:

Re: File No. 59-102

Pursuant to the request of Mr. Leon Ware, we are submitting herewith schedules showing a breakdown of amounts in the Ebasco studies of the changes in costs of the eight Massachusetts gas companies of NEES resulting from severance, together with an estimated distribution of increases in operating expenses by major accounting classifications. In view of the fact that no estimate has been made of the allocation of charges of the "Central Organization" under combined operation among the eight companies, totals only have been included for combined operation.

In addition, since some of the increases in operating expenses are considered allocable to production, and since production expenses and purchased gas were excluded from the summary tabulation of 1958 operating expenses of Massachusetts gas companies which was submitted as Respondent's Exhibit 90, it would appear that the column entitled "Total-Pro Forma" of that exhibit should be revised to exclude the amount allocable to production. A revised summary tabulation is enclosed.

We are sending you herewith four copies of each of the above-mentioned schedules.

Sincerely yours

s/ Harry Hanson

Res. Exhibit No. 105 (14 Pages)

INCREASES IN COSTS UNDER COMBINED OPERATION

The following analysis sets forth in summary form, the effect of combined operation (separate from the NEES System) versus System operation in the year 1958, or the net effect of severance as a group upon the operations of the eight System gas companies.

Under Executive, Administrative and Staff, the Pro Forma Payroll has been taken from the Supplemental Report (Exhibit 91), while the actual figures shown are derived from the Gas Severance Study - Volume I (Exhibit 58-A).

Under the various other sections, the increases in cost have been summarized from the Gas Severance Study (pages 136, 237, 348, 447, 537, 631, 725 and 831), except where changes in operations have been contemplated under combined operation versus independent operation. Each change is explained in a note or by a Supplementary Schedule detailing the basis of the change, using as a source the Pro Forma figures in the Supplemental Report and Actual figures in the Gas Severance Study.

Executive, Administrative and Staff

	Payroll	Expense Reimbursement	Payroll Taxes and Fringe Benefits	Billing for Services	Total
Pro Forma (combined operation) Central Organization	\$57!4,300	\$35,000			\$609,300
Local Organizations: Central Mass. Gas Lawrence Gas Lynn Gas Mystic Valley Gas North Shore Gas Northampton Gas Norwood Gas Wachusett Gas	31,100 43,800 58,800 61,600 60,300 37,300 32,600 31,000				31,10 43,80 58,80 61,60 60,30 37,30 32,60 31,00
	930,800	35,000			965,800
Adjustment to reduce salaries to average 1958 levels	(44,400)			(44,40
	886,400	35,000			921,La
Actual (System operation) NEPSCO Billed by Worcester	(529,900) (16,000)		(\$235,300) (5,500)	(545,% (235,% (5,%
Sub-Total	356,500	19,000		(240,800)	134,70
Payroll taxes and fringe benefits on increased payroll			\$53,500		53,58
	\$356,500	\$19,000	\$53,500	(\$240,800)	\$188,2

() Indicates red figure

The total increase in Executive, Administrative and Staff costs which would refer combined operation would affect the accounts of the eight gas companies as follows:

Operating Expenses	\$200,400
Payroll Taxes	5,500
Sub-Total	205,900
Clearing Accounts	(12,600)
Other Accounts	(5,100)
	\$188,200

RESPONDENTS' EXHIBIT NO. 106 [Letterhead — New England Electric System]

December 7, 1960

Mr. Samuel Gishman Assistant Chief Financial Analyst Branch of Public Utility Regulation Securities and Exchange Commission Washington 25, D. C.

Dear Mr. Gishman:

This is in answer to your telephone inquiry concerning reconciliation of the \$1,300 increase in "Executive, Administrative and Staff" payroll and expenses (shown on page 719 of Exhibit 58 A), which would result from independent versus system operation of Norwood Gas Company, to the accounting effect of such increase for the year 1958 as shown on page 720 of Exhibit 58 A.

In 1958, Norwood built a liquid propane plant and Norwood's 1958 actual payroll costs (see page 709 and second paragraph on page 719) included \$6,800 for payroll plus \$1,600 related fringe benefits and expense reimbursement, an aggregate of \$8,400, for the engineering services of the Malden Gas Division which were charged to plant. Under independent operation, the Executive, Administrative and Staff payroll and expense for 1958 (see page 718 and first paragraph on page 719) would have been all chargeable to expense, except for \$1,900 which is considered to be the normal administrative payroll charged to construction. Other engineering services, such as was necessary in 1958 in connection with the liquid propane plant installation, would have been obtained from an outside source and charged to plant. Moreover, an additional \$1,200 of Norwood's actual payroll was charged to other than expense accounts, i.e., \$1,000 to merchandising (see top of page 721 re merchandising) and \$200 to clearing accounts which,

it has been assumed, would have been charged to expense under independent operation. Therefore, the \$8,400 applicable to the engineering services of the Malden Gas Division plus (a) \$1,200 of Norwood's 1958 payroll charged to other accounts, (b) \$6,800 estimated increase in payroll resulting from independent operation, (c) \$500 increase in annual expense reimbursement and (d) \$800 increase in payroll fringe benefits total \$17,700 from which was deducted the actual NEPSCO billings of \$7,000 charged to expense in 1958 to arrive at the \$10,700 increase in operating expenses as shown on page 720.

I hope this explains the situation to you. If not, please phone and we'll try again.

Sincerely yours
(s) HARRY HANSON

RESPONDENTS' EXHIBIT NO. 109

DISTRIBUTION OF CLEARING ACCOUNTS BETWEEN OPERATING
EXPENSE ACCOUNTS AND PLANT & OTHER ACCOUNTS
UNDER COMBINED OPERATION (EXHIBIT 91)

Set forth on the attached tabulation is a summary of the sources of increases and decreases in charges to clearing accounts and the distribution thereof to operating expense accounts in the net amount of \$53,400 (Exhibit 91, page 40 and Exhibit 105, page 8) and to plant and other accounts in the net amount of \$28,100.

The changes in clearing account charges as shown on this tabulation are listed in accordance with the functional classifications used throughout Exhibits 58A and 91. In the Executive and Administrative category there is indicated a reduction of \$3,100 in Stores Clearing caused by eliminating NEPSCO billings to the individual gas compa-

nies which those companies had charged to Stores Clearing and which are shown in the E & A section of each company in Exhibit 58A. Also in this category is a reduction of \$2,100 in Transportation Clearing brought about by the elimination of the part time Garage Mechanic and Transportation Supervisor who was included in the actual E & A category of Northampton Gas Light Company (Exhibit 58A, page 610) and whose salary had been charged to Transportation Clearing. The final reduction in this category is \$7,400 in Other Clearing which is made up of \$1,700 in NEPSCO billings and \$5,700 of Gas Division charges. This \$5,700 is made up of (a) \$2,100 charged to intercompany billing clearing for services to the gas department of The Narragansett Electric Company (since such services would not be performed if the gas companies were separated from NEES, no such charge is made in the pro forma figures) and (b) an estimated \$3,600 representing curtailment of other actual activities charged to clearing accounts (chiefly preliminary survey and investigation) on account of the integration of the Lynn Gas department into the organization and the elimination of joint engineering services by the Lynn Gas and Electric Company, with resulting increased demands upon the Central Organization engineering staff.

The next category on the tabulation is Production, Distribution, Utilization and Garage which has a net increase of \$6,000 to Transportation Clearing made up of the

following:

\$5,500 net increase at Lynn due to a payroll increase for garage personnel in the pro forma combined operation (Exhibit 91, page 20) as compared with actual payroll for garage personnel and supervision (Exhibit 58A, page 335) adjusted to 1958 wage levels;

\$3,800 net reduction at Mystic Valley due to elimination of Suburban billing for garage services and the

substitution therefor of personnel, whose direct payroll charges only would be charged to transportation clearing, to perform these services for Mystic Valley (Exhibit 91, page 24 and Exhibit 58A, page 435);

\$4,300 net increase at North Shore due to elimination of billing by North Shore to Merrimack-Essex for garage services at North Shore's Beverly garage. Of the \$5,000 billed in 1958, \$700 was for payroll taxes and fringe benefits which do not affect clearing accounts leaving a \$4,300 increase to Transportation Clearing.

The next category is General Accounting at Lynn in which there was a net reduction of \$1,900 in charges to Stores Clearing brought about by shifting of functions of certain Works Accounting personnel to General Accounting and to Stores Accounting to be consistent with functional categories established throughout Exhibits 58A and 91. That part of Works Accounting payroll which had been charged to Stores Clearing (\$1,900) has been deducted from Stores Clearing as shown on the tabulation and the functions have been provided for in the Stores Accounting group. The detail of the above is found in Exhibit 58A, pages 340, 341, 343 and 344.

In the Stores category the net increase of \$26,800 in charges to Stores Clearing is shown in detail by companies affected on the Supplementary Schedule No. 3 of Exhibit 105 which is based on the detailed payroll analysis for each company in Exhibits 58A and 91.

The changes in Stores Clearing and Transportation Clearing in the Facilities category are based on the net changes in charges to these clearing accounts brought about by the increases or decreases in rental costs of storeroom and garage space chargeable to Stores and Transportation Clearing accounts. The detail of these changes by affected companies is shown on Supplementary Schedule No. 4 of Exhibit 105.

In the Transportation category the net increase in Transportation Clearing is \$34,400 which is detailed in Supplementary Schedule No. 5 of Exhibit 105 by companies affected. This Schedule also shows whether the increase in Transportation Clearing is due to increased number of vehicles or replacement of servicing previously provided by an affiliated company or otherwise. Supplementary Schedule No. 5 also shows the effect of eliminating intercompany billing for transportation services between Central Massachusetts and Worcester which affected Transportation Clearing and between Mystic Valley and Suburban which directly affected operating expense.

The last category on the tabulation is Miscellaneous showing a net increase of \$2,400 to Stores Clearing, \$1,800 to Transportation Clearing and \$3,100 to Other Clearing and a total of \$7,300 which are brought about by net increases in telephone charges chargeable to clearing accounts and elimination of intercompany billings which had affected clearing accounts in actual 1958 operation.

The distribution of increased charges to clearing accounts under pro forma combined operation shown at the bottom of the attached tabulation is based upon an analysis of the reason for each change in the charges to that clearing account. In the case of Stores Clearing the distribution of charges depends upon the type of materials handled. Since no change in the type of materials handled is anticipated as a result of severance, distribution of the \$45,100 net increase in charges to Stores Clearing is based upon an analysis of how the increase would have been distributed on the basis of actual type of materials handled in 1958. Therefore, the distribution follows in general the actual distribution between maintenance, construction and other accounts during the year 1958.

In the case of Transportation Clearing some of the changes in charges in this account are attributable to a change in the cost of providing transportation services for the same purposes as they were actually provided in 1958; in these cases distribution is based upon the actual use of these transportation services in 1958. Since most construction work for the gas companies was done by outside contractors the bulk of the Transportation Clearing account was charged to operating expense accounts. This would also be the case under pro forma combined operation and therefore the bulk of these increases in charges to Transportation Clearing is distributed to expense accounts. Other changes result from the necessity of providing additional transportation equipment, over and above those actually provided in 1958 principally passenger cars for customer service or general use. In these instances the distribution is based upon a consideration of the purposes for which each change in transportation equipment has been made.

The distribution of Other Clearing accounts has been arrived at in a similar way, by an analysis of the reasons for each change in charges to these accounts. The net decrease in charges to Other Clearing accounts is largely attributable to a decrease in time to be spent by the Central Organization gas engineers on matters chargeable to preliminary survey and investigation clearing and to elimination of Service Company billings charged to that account; therefore, the decrease in charges to other clearing accounts is largely distributed to plant.

Distribution of Stores Clearing Distribution of Transportation Clearing Distribution of Other Clearing		\$15,100 39,000 (700) \$53,400	\$30,000 1,700 (3,600) \$28,100	\$45,100 40,700 (4,300)

Note A - The amounts shown under miscellaneous consist of increases in telephone charges and other adjustments involving intercompany billings, the elimination of which effects clearing accounts.

RESPONDENTS' EXHIBIT NO. 110

EXPLANATION OF THE DERIVATION OF THE INCREASE IN CHARGES
TO OPERATING EXPENSES ON ACCOUNT OF EXECUTIVE,
ADMINISTRATIVE AND STAFF COSTS AS SHOWN ON
PAGE 2 OF EXHIBIT 105

Attached is a table with explanatory notes showing the derivation of the various figures shown at the bottom of page 2 of Respondents' Exhibit 105, including the figure of \$205,900 reflecting the increase in executive, administrative and staff costs chargeable to operating expense. This figure also appears at the top of the second column of figures on page 40 of Exhibit 91.

With respect to the \$12,600 and \$5,100 minus figures shown at the bottom of page 2 of Exhibit 105, the \$12,600 decrease in charges to clearing accounts is the net effect of the charges discussed in notes 4 and 7 to the attached table; and the \$5,100 decrease is the net effect of the matters explained in notes 3 and 5.

The reconciliation at the bottom of page 2 of Exhibit 105 is designed to summarize the effects on all accounts of the change in costs reflected in the main table on that page, and which must be taken into consideration in reaching the total at the bottom of page 40 of Exhibit 91. As already stated, the \$205,900 figure appears at the top of page 40 of Exhibit 91. Of the amounts entering into the \$5,100 minus figure at the bottom of page 2 of Exhibit 105, a minus \$5,700 enters into the \$8400 decrease shown for New Business costs on page 40 of Exhibit 91, as explained in note 5 to the attached table. The \$12,600 minus figure at the bottom of page 2 of Exhibit 105 is included in the net change in charges to clearing accounts as reflected in the total of \$53,400 on page 40 of Exhibit 91, to the extent it is ultimately chargeable to expense through the distribution of clearing accounts. (See the answer to the separate request for information with respect to said \$53,400 of distribution of clearing accounts.)

Sum of Items marked with asterisk (*), or Increase in Operating Expense	\$812,200	\$1,018,100	\$ 205,900

¹ See Exhibit 105, page 2.

⁴ Pro forma charges to clearing accounts are less than the 1958

actual charges on account of three factors:

^{2 15%} of Payroll.

³ Actual charges to plant were chiefly for services of Gas Division Engineers. These charges are constant upon going to pro forma organization except for an estimated additional charge of \$1,300 for engineering to be performed by the Central Organization engineers for Lynn Gas Company and charged to plant. This increase is offset by elimination of \$700 actually charged in 1958 to plant on account of joint engineering services performed by the Lynn Gas and Electric Company engineering staff.

⁽a) Included in the actual executive, administrative and staff figures for 1958 is a Garage Mechanic and Transportation Supervisor at Northampton (Exhibit 58A — Page 610) whose salary was charged to transportation clearing in the amount of \$2,100; since no person performing equivalent services is

included in the pro forma executive, administrative and staff group no such charge is made in the pro forma figures.

(b) In 1958, \$2,100 was charged to intercompany billing clearing for services to the gas department of Narragansett Electric Company; since such services would not be performed if the gas companies were separated from NEES no such charge is

made in the pro forma figures.

(c) Integration of the Lynn gas department into the organization and elimination of joint engineering services by the Lynn Gas and Electric Company, with resulting increased demands upon the Central Organization engineering staff, would require curtailment of other actual activities charged to clearing accounts (chiefly preliminary survey and investigation) in an estimated amount of \$3,600. These services would have to be obtained from outside the company, and since no provision has been made for the cost of these services in the pro forma organization, no corresponding charge to clearing accounts is appropriate.

⁵ In 1958, \$4,700 of the salary of the Assistant Manager at North Shore and \$1,000 of executive salary at Norwood was charged to merchandising (a non-operating income account). In the pro forma organization the Assistant Manager at North Shore has been eliminated and to achieve uniformity the charge to merchandising at Norwood has been eliminated. While these adjustments increase the difference between pro forma and actual executive, administrative and staff costs charged to operating expense, they have no effect on the total at the bottom of page 40 of Exhibit 91 because the adjustment is offset by a decrease in costs of merchandising (an increase in nonoperating income) which is included in the reduction in New Business expense in the third line on page 40 of Exhibit 91. (See page 3 of Exhibit 105).

⁶ Does not include billings charged directly to capital accounts.

⁷ This figure consists of \$3,100 charged to stores clearing and \$1,700 to other clearing accounts, primarily preliminary survey and investigation. No provision for equivalent services has been made in the pro forma organization.

RESPONDENTS' EXHIBIT NO. 111

MYSTIC VALLEY GAS COMPANY -

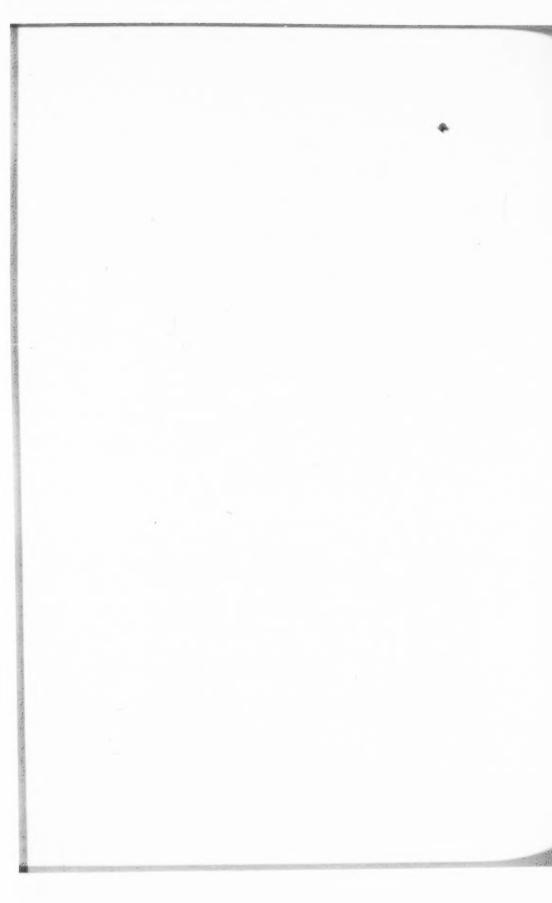

SUBURBAN ELECTRIC COMPANY
IBM Machine Rental Allocation

	Mystic Valley Gas Company	Suburban Electric Company	Total
Rentals Paid to IBM (24 Machines)	\$28,800	\$19,900	\$48,700
Amount Billed by Mystic to Suburban	(13,300)	13,300	
Amount Billed by Suburban to Mystic	11,300	(11,300)	
Allocation of Total Costs	\$26,800	\$21,900	\$48,700

The rentals paid to IBM by each of the two companies bore no relationship to the final distribution of costs, but were merely the result of a grouping of machines for purposes of billing. The purpose of cross billing between Mystic and Suburban is to arrive at an equitable allocation of total rentals between the gas and electric companies.

The allocation of costs to be accomplished by cross billing is determined by a work load analysis as follows: An analysis of work load on the machines showed 30% to be general accounting and 70% to be customer accounting functions. Furthermore, gas and electric general accounting work performed was found to be approximately equal in amount, and therefore the 30% of the total applicable to general accounting was allocated 15% to each company. The 70%, relating to customer accounting functions, was allocated 30% to Suburban and 40% to Mystic, in direct proportion to the billing work load involved. A combination of the amount allocated under each function results in an overall allocation of 55% to Mystic and 45% to Suburban which is the result of the cross billing set forth above.

In addition, customer bills for North Shore Gas Company and the Salem-Beverly-Gloucester area of Merrimack-Essex Electric Company are also prepared on these machines for which Mystic Valley bills North Shore for the gas bills prepared and Suburban bills Merrimack-Essex for the electric bills prepared. The billing to North Shore and Merrimack-Essex is based upon total machine rentals and payroll costs applicable to the total bills prepared for the four companies, with the charges to North Shore and Merrimack being allocated in proportion to the total on a cost per bill basis. The total amount billed by Mystic to North Shore for this service was approximately \$11,800, half of which is taken as a credit to machine rental costs on page 445 of Exhibit 58A and the other half as a credit to payroll costs on page 442.

RESPONDENTS' EXHIBIT NO. 116

[Letterhead — New England Electric System]

April 18, 1961

Mr. Samuel Gishman, Asst. Chief Financial Analyst Public Utility Regulation Division of Corporate Regulation Securities and Exchange Commission Washington 25, D. C.

Dear Mr. Gishman:

This letter gives the information which you requested of me by telephone on Friday, April 14.

1. Referring to Exhibit 58A and the section applicable to Central Massachusetts Gas Company and more specifically page 138, the federal income tax reduction or saving allocated to that company in 1958 due to participation in the NEES consolidated return was \$63,800. If savings from participation had been allocated without reference to the operating loss carry-over of Central utilized in the system's consolidated return in a prior year the reduction or saving allocated to Central would only have amounted to \$1,900. Now referring to the first sheet of Exhibit 59 and making the same assumption, the federal income tax reduction for Central Massachusetts Gas Company for 1958 would have been \$48,900 rather than an increase as shown of \$13,000 and gross income before interest and dividends instead of showing a reduction of \$115,500 would have shown a decrease of \$53,600.

Also referring to Exhibit 59, if the loss carry-over had not been a factor in allocating federal income tax for the year 1958 the total reduction in federal income tax of the eight companies because of participation in the NEES con-

solidated return would have been \$149,900 rather than \$203,600 and gross income before interest and dividends would have been \$903,900 rather than \$957,600 as shown.

2. As I explained to you by 'phone, Massachusetts utilities pay a framchise tax to the Commonwealth of Massachusetts which totals 4.92% of taxable net income for federal income tax purposes. This tax is charged to tax expense in the year in which it is paid and is based on taxable net income for the preceding calendar year. This means that in 1958 our Massachusetts utilities paid a franchise tax of 4.92% of their 1957 taxable net income, which was recorded as tax expense in 1958. In response to your inquiry, if we lhad adjusted tax expense in 1958 for the reduction in Massachusetts franchise tax payable in 1959 to give effect to the decreased taxable net income, the effect would have been a tax reduction of \$70,000 applicable to the \$1,495,000 reduction in gross income before federal income tax shown in Exhibit 59, while the tax reduction would have been \$54,700 applicable to the \$1,165,600 of decreased grosss income shown on page 40 of Exhibit 91.

3. Your remaining request, as I understand it, is to assume combined operation of the eight gas companies for the year 1958 as shown in Exhibit 82, and adjust for (a) the cost increases shown in the second column on page 40 of Exhibit 91 and page 8 of Exhibit 105, (b) the filing of one federal income tax return that would include the eight companies on a combined basis and ignore the loss carry-over of Clentral Massachusetts Gas Company, (c) decrease the accuruals for Massachusetts franchise tax payable in 1959 for these changes, (d) assume the same income deductions as seet forth in Exhibit 82, and give you an adjusted income statement for 1958. Four copies of such an adjusted income statement are enclosed.

DIVISION EXHIBIT NO. 1

NEW ENGLAND ELECTRIC SYSTEM 441 STUART STREET BOSTON 16, MASSACHUSETTS

HARRY HANSON

February 21, 1961

Mr. Francis H. Spencer Division of Corporate Regulation Securities and Exchange Commission Washington 25, D. C.

Dear Mr. Spencers

Re: File No. 59-102

This is in answer to an inquiry by Mr. Samuel Gishman and Mr. Leon Ware concerning an explanation of the differences between insurance costs as shown by Exhibit 89 and the amounts shown as insurance expense (Account 671) on page 306 of the 1958 Returns of the gas companies to the Massachusetts Department of Public Utilities.

The principal reason for these differences is that the costs of certain of the coverages are chargeable to accounts other than Account 671. With respect to Automobile Physical Damage Insurance and Automobile Bedily Injury and Property Damage Insurance, premium costs are charged initially to transportation clearing accounts and subsequently distributed to other accounts based upon vehicle use by the various departments. With respect to Group Life, A.D.& D. and A.& H., these amounts are charged to Account 672. With respect to Water Heater Warranty Bond, premium costs are charged initially to a suspense account, and then amortized over the estimated lives of water heaters rented to customers. The costs of the remaining coverages shown in Exhibit 89 are those that are charged to Account 671, and, to a minor extent, other accounts. Another reason for the differences is that charges by New England Power Service Company for services relating to insurance coverages are included in Account 671, as are minor charges for policies not shown in Exhibit 89.

Exhibit 58 (the Gas Severance Study) shows for each company the total increases in insurance expense under independent operation and the amounts that would effect income accounts in the test year 1958. Similarly, Exhibit 91 (the Supplemental Report on Gas Severance) shows the total insurance savings under combined operation as compared to independent operation and the amount that would effect income accounts in the test year 1958.

1/ Capiridge Gas Co., New Bedford Gas and Ed. Lt. Co., and Fitchburg Gas and Ed. Lt. Co., included in Respondent's Ex. 90, were eliminated from this statement because of joint affiliated gas and electric operations.

2/ Boston Gas did not convert to straight natural gas until 1960. (Source: Srown's Directory of American Gas Companies -- 74th Edition).

3/ Per customar figures not comparable due to shnormally small number of customers reported at year and in relation to number of customers served during the year.

40 NEW ENGLAND UTILITIES IT AN LIQUEFIED NATURAL GAS STORAGE PROJECT: (Journal of Commerce, February 7) -- By Lewis Brigham -- Forty gas utility firms in four New England States are pushing toward the construction of a natural gas liquefaction plant to help meet the area's chronic fuel price problem. Talked about for years, the formation of the New England Gas Pooling group last year is aimed at developing an underground refrigerated supply of liquefied methane during the low demand summer months to help offset heavy line withdrawals during the peak winter demand months. Impetus for the plan really originated three years ago when in the middle of the winter heating season the main line for one of the two natural gas transmission lines serving New England broke down. Additional impetus came from the dramatic success scored by the tanker, Methane Pioneer, which, outfitted with special aluminum and balsa wood tanks to hold the liquid methane at its required 258 degrees below zero during shipment, brought seven cargos of southwestern U. S. methane to the London, England, gas system.

Future developments for the Methane Pioneer plan of tankering liquefied methane await decision from the British Gas Council, but in the meantime, the New England gas companies are about to move themselves. At the same time, the American Gas Association has been conducting studies which will have a definite bearing on the New England program, even though carried out separately. The AGA research has been aimed at developing a more economic form of storing the methane which must be brought down to 260 degrees below zero in order to be kept in a liquid state. "Cyrogenic," or underground, storage is the key to methane's commercial usage in gas utility operations, according to the AGA, which now says the best storage prospect is a concrete vault as opposed to the prohibitively expensive aluminum and balsa wood design used on the Methane Pioneer for its seven voyages to ond on.

In fact the AGA hopes to erect a pilot storage unit this fall at a site yet to be determined using reinforced concrete and insulated walls. This will be a small 1,000-barrel unit for experimental purposes primarily. While the details of the New England plan with regard to storing the liquefied methane have not been made clear as yet, chances are it will embody the AGA concrete approach to an extent. This is particularly true

inasmuch as New England lacks depleted gas fields where product can be stored as is the case in the southwest producing areas. Best bets for the location of both the gas liquefaction plant and storage area though is said by area utility observers to be somewhere near Worcester, Mass. which is central to the four states involved -- Connecticut, Rhode Island, New Hampshire and Massachusetts. For the New England gas customers, as well as the firms themselves, the development could mean a real boom. Chionically beset with energy price problems during the winter months, the area is highly vulnerable to peak energy prices and line breakdowns.

The New England utilities would, of course, purchase the so-called "valley" gas, that is, the product available to the utilities in the summer when it is at its most plentiful and offered at its best rates. On this basis, the engineering firm of Stone and Webster is understood to have told the New England group that this "valley" gas would be available 15¢ per thousand cubic feet below the price indicated in earlier plans for Venezuela liquefied methane which could be tankered in during the winter to meet the season's peak demands. The transmission lines are expected to be enthusiastic over such an operation which would aid in leveling out the "peaks and valleys" of their seasonal demand pattern.

POWER PLANT AUTOMATION BREAKTHROUGH EXPECTED THIS YEAR: (New York Times, February 5) -- By Gene Smith -- This is supposed to be the year for the automated electric power plant. Both engineers and manufacturers of automation equipment that controls the various operations of a modern power plant feel that the actual breakthrough will come this year, either in Louisiana or on the Pacific Coast. The Louisiana installation should have the first chance. It is the Little Gypsy plant of the Louisiana Power and Light Company, an operating subsidiary of the Middle South Utilities System. This parent company already has logged successful operations in certain phases of the automation field. Only last week at the winter meeting of the American Institute of Electrical Engineers, Gerhard L. Hollander said that a process control computer in Louisiana Power's Sterlington station had run almost continuously

(Continued on next page)

day and night for six months in guiding a power plant's operations. It was out of use, for maintenance and related reasons, less than one percent of the time during this half-year test period. A spokesman for Middle South said that the Sterlington computer's performance actually had been "99.99 percent perfect." The computer was supplied by Daystrom, Inc., for the 225,000-kilowatt unit.

And Middle South also controls its three-state network -- Arkansas, Louisiana and Mississippi -from a central dispatching office at Pine Bluff, Ark. The heart of this operation is a generation computer designed by Leeds & Northrup Company. The California chance will come later this year at the Southern California Edison Company's Huntington Beach generating station. The General Electric Company's computer department at Phoenix, Ariz., is supplying the computer equipment for what it described as "the world's most advanced computer -- automated steam-electric power generating units." This computer-controlled system will start and stop the generating equipment, provide data-logging and alarm functions, make continuous performance calculations and maintain constant supervision of the generating units. This will mean continuous scanning to monitor conditions such as fuel and water flow, steam temperatures and pressures and electrical values.

Scanning must be done at rates up to 300 points a second, which is said to be the equivalent of digesting the contents of a 300-page book in five minutes. Each hour, 50 critical quantities that are needed for permanent records of operating conditions will be logged in a digital code and printed on an automatic typewriter in the form of common engineering terms. The new system is even equipped to handle automatically hot and cold starting, normal and emergency shutdowns and complete supervision of the boilerturbine-generator systems. Utilities have long been users of computers for such relatively simple functions as billing and engineering department calculations and studies, as well as for automatic dispatching equipment to call on various power stations and units for best performance under all conditions. Industry spokesmen estimate 22 automation contracts have been signed for delivery of power-generating units linked with computers through 1964. Ebasco, the large consulting and engineering concern, expects to purchase at least six automation systems for power stations within six months. Thompson-Ramo-Wooldridge, Inc., reportedly has at least 18 propositions outstanding with consulting engineers and utilities for steam plant automation equipment.

The original reason for utilities to buy such equipment was simply the question of whether

it was cheaper to spend dollars for equipment or hire more workers. L. F. Kennedy, manager of G. E. 's system protection and control engineering operation, explained that today. as the processes become more and more complex and larger amounts are invested in equipment, man is no longer able to absorb all that is going on and to react fast enough to control efficient operations. "An operator today would have to have a fantastic memory and a pair of roller skates to duplicate the ability of a computer to effectively analyze 1,200 bits of information every 15 seconds, as will be done with future power stations, "he said. Mr. Kennedy predicted that before 1970 the power industry would see all units of 250,000 kilowatts and larger digitally-controlled. Smaller units will follow soon after. W. J. McLachlan, manager of G. E. 's electric utility systems engineering operation, explained that a 500,000kilowatt steam station could realize capitalized savings of about \$1,250,000 to \$2,750,000 through complete automation. A spokesman for Leeds & Northrup estimated that a digital computer and minimum associated gear would cost about \$250,000 if used for computation only. If control gear is added, the cost may be "two, three or ten times" as great depending on the end use, he said. Nevertheless, the company finds that about 20 percent of its over-all business comes from power plant instruments, controls and computers and that volume in this area is improving.

LAKE SUPERIOR DISTRICT POWER'S \$3 MILLION BONDS ARE AWARDED: (Wall Street Journal, February 8) -- Chicago -- Lake Superior District Power Company awarded its \$3 million of single-A rated first mortgage bonds to Salomon Bros. & Hutzler and Baxter & Co. The successful bid was 99.577 for a 4-5/8 percent coupon. That gave the utility, based in Ashland, Wis., an annual net interest cost of about 4.65 percent. Salomon Bros. and Baxter & Co. planned to release the bonds for general distribution, following compliance with Securities and Exchange Commission requirements, at 100.404, to yield 4.60 percent to maturity on February 1, 1991. Preoffering indications of retail interest in the issue at that price and yield were described as 'Yrom fair to good. " The new 4-5/8s will be optionally redeemable by the utility at prices ranging from 105.03 down to par. Other bids came from Halsey, Stuart & Co., Inc., 99.414 for a 4-5/8 percent coupon; Kidder, Peabody & Co. and White, Weld & Co., jointly, 99.31 for a 4-3/4 percent coupon, and Robert W. Baird & Co., Inc., 99. 949 for a 4-7/8 percent coupon. Lake Superior District Power will put the proceeds into its construction program.

No. 6332

NEW ENGLAND ELECTRIC SYSTEM ET AL., PETITIONERS,

υ.

SECURITIES AND EXCHANGE COMMISSION, RESPONDENT

ON PETITION FOR REVIEW OF AN ORDER OF THE SECURITIES AND EXCHANGE COMMISSION

Before Aldrich, Chief Judge, Sweeney, Chief Judge, and Wyzanski, District Judge

John R. Quarles, with whom Richard B. Dunn, Richard W. Southgate, John J. Glessner, III, and Ropes & Gray were on brief, for petitioners.

David Ferber, Solicitor, with whom Philip A. Loomis, Jr., General Counsel, Ellwood L. Englander, Assistant General Counsel, Martin D. Newman, Attorney, and Solomon Freedman, Director, Division of Corporate Regulation, Securities and Exchange Commission, were on brief, for respondent.

OPINION OF THE COURT

June 4, 1965

ALDRICH, Chief Judge. This is a petition seeking to review and set aside a divestment order of the Securities and Exchange Commission pursuant to section 11(b)(1) of the Public Utility Holding Company Act of 1935, 15 U.S.C. § 79k(b)(1), requiring the petitioner, New England Electric System (NEES) to dispose of its gas utility properties by terminating its rela-

tionship with its eight subsidiary gas companies. The
1456 ultimate question in the case, which the Commission
resolved against NEES, was whether divestiture would
cause the loss of "substantial economies" within the meaning
of the cited section.

(1455)

Briefly, NEES is a registered holding company controlling. at the time of the hearing, fourteen electric utility subsidiaries and eight gas subsidiaries, with some 824,000 retail electric customers in the states of New Hampshire, Massachusetts. Rhode Island and Connecticut, and some 237,000 retail gas customers in Massachusetts. Seventy-eight percent of its gas customers are also served by the electric companies. Except for certain peaks and emergencies the gas distributed is natural gas supplied by pipe line companies from the southern United The gas companies have separate offices and management, but their top officers are responsible to the top officials of NEES. There was a lengthy hearing before an examiner at which NEES sought to show that the cost of divestment to the electric system would be \$804,000 annually, and to the gas system, if operated as a single unit after severance, \$1,098. The Commission held, inter alia, that the financial effect upon the electric system was not a relevant inquiry, but that if it was it was not significant. This we do not reach. It also held, which we do reach, that the claimed financial consequences to the gas system were not substantial as it construed the statute, but that if they were they had not been adequately proven.

Basic to its decision, as the Commission recognized at the outset of its opinion, is the meaning of the Act and the standards which it imposed. Briefly, section 11(b)(1) required divestiture unless NEES could satisfy the provisos 1457 or exceptions 2 contained in sub-paragraphs, or clauses,

(A), (B) and (C). Clauses (B) and (C) were admit-

tedly met. Clause (A) reads as follows:

"(A) Each of such additional systems cannot be operated as an independent system without the loss of substantial economies which can be secured by the retention of control by such holding company of such system;"
Before considering whether the Commission's interpretation of this clause was correct we must determine what its inter-

^a The Commission uses the word "exceptions," and criticizes NEES word "provisos." NEES distinction, as we read it, was in response to a heavy burden of proof which the Commission sought to attach to exceptions. See fn. 4, infra.

¹ NEES' actual figure was \$1,165,000, but the Commission reduced this by \$67,000 as a result of a "revised basis of payments" authorized by it NEES does not presently dispute this adjustment, but points out that the reverse adjustment must be made to the estimated electric system losses.

pretation was. At the beginning of its opinion the Commission

stated that to prevent divestiture NEES must show.

"that the additional systems were integrated in nature and 'were so small that they were incapable of independent economic operation' and had a 'real economic need' for management together with the principal system. Congress was aware that some loss of economies would usually result from the separation of jointly controlled utility systems, but considered that continued joint management should be permitted only where separation would entail a loss of economies which would be substantial in the sense that they were important to the ability of the additional system to operate soundly." [Footnotes omitted.]

The Commission then quoted at length from a decision by the Court of Appeals for the District of Columbia,³

1458 from which it drew the conclusion that clause (A) required a "showing by clear and convincing evidence" that such additional system cannot be operated under separate ownership without the loss of economies so important as to cause a serious impairment of that system." Lastly, at the end of its opinion, the Commission concluded that on the record it was unable "to find that the gas companies could not be

^{*}Engineera Public Service Co. v. S.E.C., 138 F. 2d 936, 944 (1943). This case is extensively relied on in the Commission's opinion without noting that certiorari was granted, 322 U.S. 723 (1944), and the decision subsequently vacated as moot. 332 U.S. 788 (1947). (This omission is remedied in its brief.) We do not know whether the view of the majority, or the dissent of Judge Soper, which accords with ours, would have ultimately prevailed.

^{&#}x27;The Commission has been criticized before for using this phrase, the court allowing it to pass, however, on the ground that it meant no more than the fair preponderance of the evidence, the ordinary burden of proof. Philadelphia Co. v. S.E.C., D.C. Cir., 1949, 177 F. 2d 720, 725. We do not agree. This phrase has a well recognized meaning, and is applied in special cases, such as trand, Lackaranna Pants Mfg. Co. v. Wiseman, 6 Cir., 1943, 133 F. 2d 482, 486, or mistake, Philippine Sugar Estates Devel. Co., Ltd. v. Philippine Islands, 1918, 247 U.S. 385, 391, as applied in Aeraa Ins. Co. v. Paddock, 5 Cir., 1962, 301 F. 2d 807, 811. The Commission is to be criticized for continuing to use this language, which by its tone suggests to laymen, as well as to lawyers, a heavy burden. We suspect, from other statements in its opinion, that it accurately revealed the Commission's approach. If so, in any future proceedings the Commission should readjust its receptivity as well as its phraseology.

soundly and economically operated independently of NEES. even assuming the validity of * * * [its] estimates."

Thus the statutory phrase, "cannot be operated as an independent system without the loss of substantial economies." was said to mean, "incapable of independent economic operation;" "important to the ability * * * to operate soundly:" "so important as to cause a serious impairment of that system:" and "could not be soundly and economically operated."

In Middle South Utilities, Inc., 35 S.E.C. 1, 11 (1953), its most recent decision cited in its opinion for the support of its interpretation, the Commission ordered a divestment because it had not been shown that it would "cause the serious economic impairment of the system or that the gas properties could

not operate effectively and efficiently under separate ownership." (Ital. suppl.) Since presumably the

Commission did not intend to voice simultaneously two different standards we read the word "or" as introducing an explanation or equivalency. Essentially this second Middle South Utilities phrase is the sole standard that the Commission adopts in its brief before us.

Also may be noted the Commission's statement, in refutation of one of NEES' contentions, that "other independent gas utility companies in the state * * nevertheless have been able to conduct their operations and, apparently, earn a fair return without the alleged advantages of common control with electric utilities by a holding company."

Taking the record as a whole we find its brief accurate, and that the Commission's interpretation is that a loss is not "substantial" unless it would render impossible "economical or effi-

cient operation." 5

As to the correctness of this interpretation we have not considered before the meaning of clause (A), and there is no uniformity of judicial view elsewhere. It is true that in North American Co. v. S.E.C., 1946, 327 U.S. 686, 696-7, the court

NEES suggests there is no practical difference between preventing economical operation and bankruptcy. The Commission does not address itself to this question. We assume it believes there to be a difference, but except to the extent suggested in fn. 7, infra, we cannot find from its opinion what the difference is, or, more important, what is the standard by which uneconomical operation is determined. The very serious problem which this would present we do not reach because we disagree with the Commission's basic interpretation.

referred to section 11(b)(1) as permitting retention only of "relatively small [companies] * * * unable to operate economically under separate management without the loss of substantial economies * * * *." This was a passing summary, and did not purport to be an exact characterization. The precise meaning was not relevant to the constitutional questions then under consideration, and even if the court's language is not considered ambiguous we do not take it as an at-

tempt to resolve possibly intricate questions of construction. We turn, therefore, to other considerations.

Although we do not regard the legislative history as determinative, we begin there as the Commission makes much of it. Its principal reliance is upon the concluding remarks of Senator Wheeler on the floor after the bill had finally passed both Senator Wheeler stated, inter alia, that the act perbranches. mitted a holding company to retain more than one integrated system only when the additional systems "* * were so small that they were incapable of independent economical operation." 79th Cong. Rec. 14479 (Aug. 24, 1935). We may note, at the outset, that only by a most generous interpretation is this statement part of the legislative history. Having come afterwards, it could not have affected the voting. The best reason for considering it as evidence of Congressional intent, see United States v. United Mine Workers, 1947, 330 U.S. 258, 279-80; Duplex Printing Press Co. v. Deering, 1921, 254 U.S. 433, 477: cf. State Wholesale Grocers v. Great Atlantic & Pacific Tea Co., D.C.N.D. Ill., 1957, 154 F. Supp. 471, 485, rev'd on other grounds, 258 F. 2d 831, cert. den. 358 U.S. 947, is accordingly absent.6 Furthermore, coming from the leading Congressional

⁶ See Hart and Sacks, The Legal Process: Basic Problems in the Making and Application of Law (tent. ed. 1958) 1285;

[&]quot;The views of individual members of the legislature as to the meaning of a statute which were not officially communicated to the legislature prior to its enactment are not competent to be considered in determining the meaning which ought to be attributed to the statute."

Nor could it have invited a presidential veto, since the President was a known advocate of a strong bill. See 79 Cong. Rec. 3425-26, 3469-70, March 12, 1935 (Message to Congress); id. at 9042, June 11, 1935 (letter to Senator Barkley and Senator Wheeler); id. at 14164, Aug. 22, 1935 (letter to Representative Rayburn).

advocate of strict separation, see, e.g., 79 Cong. Rec. 1525, Feb. 6, 1935; id., 4903 (radio address of April 2, 1935); id., 14470,

Aug. 24, 1935 (remarks of Senator Norris), it would seem natural to regard it, at that stage of the proceedings, as a

self-serving declaration. To the cynically minded it would seem to have been merely a post-contest attempt to raise the score, recapture what had been lost in the compromise with the House discussed *infra*, and to serve, just as is now being sought, to influence subsequent history. The best that should be said for Senator Wheeler's statement under these circumstances is that it is not to be given the weight to which it

might have been entitled if made at another time.

The other pieces of legislative history related in the Commission's brief are a quotation from remarks by Representative O'Connor speaking "of 'a little power plant in Florida' or 'a little plant in Oklahoma' (79 Cong. Rec. 14168, Aug. 22, 1935)" and one from Representative Cooper, "who had opposed the motion, [and] had referred to systems retainable under Clause (A) as 'unprofitable companies * * * too weak to stand alone' (id. at 14165-14166)." Examination of Representative O'Connor's full statement rebuts the economic implication the Commission wishes us to attach to the word "little." It is evident that the remarks were addressed to geographical aspects. the absentee landlordism condemned in clause (B). It is true that Representative Cooper was speaking of clause (A). But it seems apparent that as an opponent of the bill he was strategically engaged in blackening it. According to him the compromise was no compromise whatever, a position demonstrably unsound. His interpretation of particular clauses must be read in that light. Labor Board v. Fruit & Vegetable Packers & Warehousemen, Local 760, 1964, 377 U.S. 58, 66.

A much more pertinent characterization of the phrase "substantial economies" is found in the statement of the House Managers attached to the conference report recommending

passage of the compromise draft, that the retention of additional systems was to be permitted where there was a "real economic need." H.R. Rep. No. 1903, 74th Cong., 1st Sess., 71. This language, however, is itself ambiguous. Obviously there would be a real economic need to prevent a loss that would preclude efficient or effective operation. But there could also be said to be a real economic need to avoid any truly sizable financial loss notwithstanding the utility's

ability to absorb it and remainefficient in some absolute sense.7 For reasons we now come to we believe the statute is to be

given this more general meaning.

The declaration of legislative objectives is found in section 1(b). Subsection (1) thereo concerns improper accounting practices, capitalization, etc., that may injure investors. Subsection (2) refers to excessive charges and other effects of transactions among companies within a holding company system. It also, together with subsection (3), refers to impediments occasioned by the holding company device to state regulation. We quote in full the remaining subsections, which declare the public interest to be adversely affected.

"(4) when the growh and extension of holding companies bears no relation to economy of manage-1463 ment and operation or the integration and coordination of related operating properties; or

"(5) when in any other respect there is lack of economy of management and operation of public-utility companies or lack of efficiency and adequacy of service rendered by such companies, or lack of effective public regulation, or lack of economies in the raising of cap-

ital." (Ital. suppl.)

Pausing here we note in the inderlined phrases two concepts, economy of management and operation, and efficiency (and adequacy) of service. The vord "or" in clause (5) is clearly used in the disjunctive. This separate meaning is emphasized when we come to section 11(b)(1) clauses (A) and (C), infra. It will be sufficient to note here, for both present and future purposes, that the Commission has taken the word

^{&#}x27;We have already commented upon the Commission's failure to enunciate any standard beyond this broad generalization of economy or efficiency. See fn. 5, supra. Possibly its view are partly implied by the points made in its opinion when assuming that an annual loss of \$1,098,000 had been adequately established. The first was that while this amount is larger, absolutely, than losses required to be accepted in any previous case, it is not larger relatively. Secondly, that the loss would be only 23.28% of gross income, and 29.94% of net income before federal income taxes. (The word "only" is ours.) Third, that there are "other independent gas utility companies in the state which nevertheless have been able to conduct their operations and, apparently, earn a fair return * * * and * * * compete effectively * * *." Finally, that it "would be entering the realm of speculation at this time to assume that rate increases would ensue from severance."

"efficient" from this use in connection with service and joined it with the phrase "economy of management and operation," and has then built out of the combination the concept that until a loss of economy and efficiency is shown to be total there has been no loss of substantial economies under clause (A) within Congressional concern. We may note, also, an omission which we take seriously, that on the sole occasion that the Commission quoted clause (4) it substituted asterisks for the phrase we have italicized, and, although the legislative meaning of economies is the specific matter under consideration, has never referred to it. Clause (5), likewise, is never mentioned. Conceivably this may be good advocacy. We do not think it candid administrative practice.

The definitions of "integrated public-utility systems" are found in section 2(a)(29). Subsection (A) defines an integrated electric system as one which, inter alia, "may be economically operated as a single interconnected and coordinated system." Subsection (B) defines a gas system as where.

inter alia, "substantial economies may be effectuated by being operated as a single coordinated system." During argument we inquired the reason for this difference. gestion was forthcoming. The only reason apparent to us is that in order for electric companies to constitute an integrated public utility system they must meet a technical requirement not applicable to gas companies seeking to qualify as an integrated system. Unlike gas companies, General Pub. Util. Corp., 1951, 32 S.E.C. 807, 834-35, electric companies must be "physically interconnected or capable of physical interconnection." Where this requirement is met, so that actual interchanges of power could be made to meet power requirements at different points in the system, it was enough for Congress that the system as a whole "may be economically operated as a single inter-connected and coordinated system." Assuming the other qualifications were met electric companies would not have to prove that system ownership would be cheaper than independent ownership, probably because this could safely be assumed where there would be a sharing of power.

Coming to section 11(b), the primary provision, subsection (1) requires that holding companies be restricted to a single

integrated public utility system except when subclauses (A), (B) and (C) are satisfied. For clarity we quote in full.

"(A) Each of such additional systems cannot be operated as an independent system without the loss of substantial economies which can be secured by the retention of control by such holding company of such system;

"(B) All of such additional systems are located in one State, or in adjoining States, or in a contiguous

foreign country; and

"(C) The continued combination of such systems under the control of such holding company is not so large (considering the state of the art and the area or region affected) as to impair the advantages of localized management, efficient operation, or

the effectiveness of regulation."

These exceptions to section 11(b)(1) were added as a result of a compromise with the House. The original Senate bill had flatly restricted holding companies to a single integrated system. S. 2796, 74th Cong., 1st Sess. (1935). The House sought to permit as many systems as were consistent with the public interest. See H.R. Rep. No. 1318, 74th Cong., 1st Sess. 17 (1935). The Commission's then chairman objected that this would be intolerably indefinite. 79 Cong. Rec. 10838 (July 9, 1935) See also H.R. Rep. No. 1318, supra, at 45. Clauses (A), (B) and (C) were proposed as a compromise to establish "definite and concrete circumstances" where retention of more than one system would be allowed. Statement of House Managers, supra, at 70.

It is basic to the Commission's position that the phrase "substantial economies which can be secured by the retention of control" in clause (A) is fundamentally different from "substantial economies [that] may be effectuated by being operated as a single coordinated system" in section (29)(B).

^{*}The Commission is committed to this, and expressly so recognizes in its brief, because it rejected certain important evidence offered by NEES solely on the ground that the eight gas companies were conceded to be "a single integrated system." Since the Commission could not, either in good conscience or in law, accept as a concession a matter so fundamental, not only to the present proceedings, but for the future, if it were contrary to the fact, it stands that the Commission feels that saving \$329,400 annually by integrating the eight gas companies is effectuating substantial economies under section (29) (B), but that \$1,098,600 annually is not substantial economies under clause (A).

Such a contention, of course, is opposed to the common principle that the same words in different portions of an act are presumed to have the same meaning. In this case they are exactly the same." To overcome the presump-

tion calls for an affirmative showing.10

Furthermore, we find the Commission's interpretation of clause (A) opposed to the initial statement of the purposes of the Act, supra, the tenor of which was that holding companies had been found uneconomical to investors and to the public. It is not inconsistent with this to say that systems which do not offend in this respect, or in the other respects defined in clauses (B) and (C), should be continued instead of broken up, and that occasioning a loss of impressive proven economies was not the Congressional purpose. This was a business reorganization act designed to produce a healthier economic structure in a vital industry. It established what, in the opinion of Congress, accomplished the best overall conditions. At the same time, Congress remained receptive to what, in a particular instance and within the limits established by clauses (B) and (C), might be affirmatively shown to be a more economical arrangement. We hold that clause (A) called for a business judgment of what would be a significant loss, not for a finding of total loss of economy or efficiency. Louisiana Pub. Serv. Comm'n v. S.E.C., 5 Cir., 1956, 235 F. 2d 167, rev'd on jurisdictional grounds, 353 U.S. 368.

We are confirmed in this view by the fact that not only do clauses (B) and (C) contain additional conditions of retention, so that clause (A) need not be interpreted so as to cover the entire Congressional intent, but that these other clauses relate back fully to counterparts of the declarations of purpose made in section 1(b), and the attempts

^{*}The Commission's brief goes to some length in emphasizing the word "loss" in section 11(b)(1)(A). Sections 2(a)(29)(B) and 11(b)(1)(A) are not incomparable because the former speaks in terms of effectuating and the latter in terms of losing. The important comparison is the word "effectuated" in the one section and "secured" in the other. Both relate directly to "substantial economies."

[&]quot;In a special effort to make this showing counsel argues that there is a policy in the Act against an electric utility system being combined with a gas system. The short answer to this is that neither the Act, nor the Commission itself, says so. Since, however, counsel's argument is extensive we will reply in kind, but in order not to prolong this footnote we will do so in an appendix, infra.

to effectuate those purposes through the definitions made in section 2(a)(29), supra. Clause (A) would do the same were it not for the special restricted meaning that the Commission seeks to give it. The Commission, in other words, has attached to "substantial economies" in this one particular place a special meaning that nothing in the Act points to, and which,

in fact, destroys its symmetry.11

It might not be inappropriate to conclude with the quotation with which the Commission began a section of its brief. "As was stated [the brief says] in the report of the National Power Policy Committee: '[I]ntensification of economic power beyond the point of proved economies not only is susceptible of grave abuse but is a form of private socialism inimical to the functioning of democratic institutions and the welfare of a free people." * * * H. Doc. No. 137, 74th Cong., 1st Sess. 4 (1935), appended to S. Rep. No. 621, 74th Cong. 1st Sess." We cannot think that "proved economies" any more than "substantial economies," mean anything other than economies which in ordinary business parlance and by ordinary business standards are of a substantial nature, considering, of course, the size

of the companies to which the economies relate.¹²
1468 Clearly that was what was meant elsewhere in the Act.
If in clause (A) Congress meant, instead, "cannot be

operated efficiently as an independent system" it could readily have done so not only more clearly, but in fewer words.

The Commission's only answer is "the policy of the Act." We think the policy of the Act is to be found in the whole Act, not in one part. NEES has the burden of proving that it falls within an exception. This is enough, without a forced reading into that exception of some special meaning.

We regret the length of this discussion. Since, however, we find the Act not only consistent, but entirely responsive to

[&]quot;Drawing an equivalence between the proviso contained in clause (A) to section 11 and the corresponding requirements for an integrated gas system under section 2(a)(29)(B) nullifies no technical requirements in the definition of an integrated gas system because there are none. The definition of an integrated electric system under section 2(a)(29)(A) does contain some technical requirements, as has been pointed out, but these, also are not nullified by our interpretation of clause (A) since it remains stricter than section 2(a)(29)(A)'s requirement that the electric system "may be economically operated."

¹³ In this case the claimed losses are over 23% of gross income. See fn. 7.

analysis, we feel such analysis called for in fairness to those persons, whether investors or consumers, ¹³ who must absorb perhaps a million dollars a year (quite apart from over \$800,000 allegedly lost to the electric system) which the Commission feels insubstantial.

The Commission having applied the wrong standard, its decision must be reversed unless on the record there could have been no finding in NEES' favor on the appropriate standard. We think clearly there could have been. NEES' case was based essentially upon a study made for it by Ebasco Services, Inc., (Ebasco), a management consultant which the Commission found possessed extensive experience in the utilities field. No rebuttal evidence, other than some exhibits, was offered on behalf of the Commission, which grounded its rejection of the report, to the extent that it did reject it, solely on criticism of the report's conclusions in the light of NEES' evidence or its own expertise. Its specific criticisms related to that por-

ling \$472,100 or more specifically, for the most part, customer and accounting costs included therein, for which the Ebasco estimate was \$415,600. The first criticism concerned billing. The circumstances were these. Ebasco's original study was made on the assumption that the gas companies would be individually managed. On this hypothesis it naturally assumed that each company would conduct separate customer billing. When the Commission took the position that the gas companies constituted a single integrated system and should be sold as such, Ebasco was required to reduce its estimate by the amount attributable to operating the gas companies individually rather than as a unit. It made no reduction with respect to customer billing.

On this subject NEES called three witnesses. One Quig, a representative of Ebasco with ample qualifications, testified to certain accounting savings that could be effected if the gas companies were operated collectively rather than individually. He stated, however, that Ebasco would not recommend, at

¹³ The Commission's finding it significant that it was sufficiently shown that this loss would require an increase in rates "at this time," fn. 7, supra, not only disregards the fact that the cost of doing a utility business normally is passed on to consumers eventually, but the fact that one of the purposes of the Act was to benefit legitimate investors.

least at the outset, centralization of certain matters, including billing; that a continuing study might show that further centralization would prove useful, but that it was by no means clear that economy lay in that direction, and that it would depend on such factors as business growth, new developments in mechanization, etc. Subsequently one Dalbeck, the principal officer of NEES' gas division, testified that it was conceivable that centralized billing might be effected to some degree, but that in his opinion it was not really important cost-wise; that he had made many studies of customer accounting procedures and had never found any real economies in centralization of billing. Thereafter one Johnson, an Ebasco representative with particular experience in customer accounting, testified that a detailed study would have to be made, which

Ebasco had not done; that based upon his experience he
1470 had considered centralized billing for the combined operation and had made the judgment that there would
be no economy, or at least "any substantial savings." The
witness was cross-examined at length and showed a wide knowledge not only of specialized mechanical equipment in this area
and the problems involved, but also of the particular practices
of a large number of named utilities in various parts of the
country. He recognized that in many instances centralized
billing prevailed, but continued to express doubts as to how

much was saved thereby.

The Commission's response to this was to point out that some of the NEES gas companies presently combined their billing with the electric companies in their areas. This matter had been explained by NEES' witnesses, who pointed out, inter alia, the duplication of customers, which would not exist in the case of gas companies operating alone. The Commission concluded, however, that NEES had not "given any satisfactory reason why at least some form or forms of combined billing procedure could not be employed advantageously by the gas companies, in light of the fact that their aggregate of 237,000 customers is located in a relatively compact area."

We have serious doubts as to the extent that the Commission is entitled to disregard an opinion on a matter obviously requiring expert, specialized knowledge with no further evidence before it than what had been considered by the accepted expert. Cf. United Shoe Mach. Corp. v. Industrial Shoe Mach. Corp., 1 Cir., 1964, 335 F. 2d 577, 579, cert. den. 379 U.S. 990;

Security-First National Bank v. Lutz, 9 Cir., 1963, 322 F. 2d 348, 355; Alvary v. United States, 2 Cir., 1962, 302 F. 2d 790, 794; Cullers v. Commissioner, 8 Cir., 1956, 237 F. 2d 611, 616. This is not a matter on which a body having such broad jurisdiction as the Commission can have detailed expertise upon which to base affirmative findings. Compare Market

which to base affirmative findings. Compare Market 1471 St. Ry. v. Railroad Commission, 1945, 324 U.S. 548, 560.

Without finally passing upon this point, since the case must go back in any event, we suggest that on this record the maximum the Commission was warranted in inferring was that the difference in costs between separate and combined billing would not, if significant at all, constitute a sizable portion of

the total added billing expense.

This brings us to what was the added billing expense, and hence the amount of error attributed to the Ebasco report because of its failure to assert the saving which, in the Commission's opinion, could be effected by having centralized billing. The Commission concluded merely that Ebasco's failure caused the estimate to be "overstated." It did not concern itself with discovering even what were the total increased billing costs, let alone the portion (obviously not the whole) which might be saved if centralized billing were adopted. It did find that the increased billing costs estimated for two of the eight gas companies, billing singly after divestiture, was \$34,700 for the These companies covered more than half of NEES' gas customers. On a pro rata basis this would make the total billing increase for all companies \$60,000. While doubtless such a projection is not precise, it seems significant that the Commission was not sufficiently interested to make any at all. Under the circumstances we do not think it unreasonable for us to point out that while the Commission was purportedly criticizing a cost estimate of over \$400,000, strictly it was speaking of perhaps \$60,000, only a portion of which could have been overstated.

We might have more sympathy with some, but not all, of the Commission's criticism of certain other alleged accounting disparities. Frankly, we are not sufficiently versed, nor do we find the record sufficiently helpful, to permit our analyzing find the record sufficiently helpful, to permit our analyzing

them in every detail. However, it has not been contended that, even cumulatively, they remove from the Ebasco \$472,000 cost estimate many sizable items. After discussing the above matters the Commission said.

"In view of respondent's burden of proof and the absence of a persuasive explanation on the record, Ebasco's failure to consider employment of combined billing procedures and its inadequately explained disparate treatment of certain effects of severance on the gas and electric companies, respective, substantially impair the credibility and preclude the acceptance of its estimate of a \$472,100 increase in treasury and accounting costs and, in turn, of its over-all estimate of increased costs (of which that figure is a material part) in the determination of whether severance would result in a substantial loss of economies."

If this constitutes a finding that the deficiencies which the Commission believes it has found are so serious that the Commission was entitled to reject the balance of the report from that very fact, we cannot agree. The doctrine of "falsus in uno, falsus in omnibus," so far as it has any value, ordinarily applies to cases of deliberate falsehood. See 3 Wigmore, Evidence § 1013 (3d ed. 1940). The Commission has not suggested, and we see no possible basis for suggesting, that the discrepancies it complains of indicate bias or dishonesty. Absent a finding that the errors found are related to, or infect, other matters not directly discredited, if the "falsus in uno" doctrine, or a corollary, is to be used on any further basis to impeach an expert's report, it must be shown that the errors are so serious that they indicate substantial carelessness, or otherwise impugn the expert's qualifications. See, e.g., Hoag v. Wright, 1903, 174 N.Y. 36, 43; 66 N.E. 579, 581. Again, the Commission made no such findings. If there was a ground for them it has not been

suggested. Indeed, the Commission demonstrated its 1473 confidence in Ebasco elsewhere by accepting its cost estimates as the basis for concluding that the gas companies constitute an integrated system.

On the record there is a large, residual showing in the Ebasco report. Even at minimum it is \$1,098,000 minus some fraction of \$472,000. However, we do not think it presently appropriate for us to consider whether such minimum showing meets our interpretation of "substantial economies." We do state, however, that on remand the Commission must address itself to this problem by making specific findings, and not content itself with general conclusions. One illustration of this will suffice. The Commission states in its brief that it "had

the right to consider competitive advantages of separation in offsetting alleged losses of economies." We do not question this. What we do question is the Commission's failure to find or articulate any specific or approximate financial benefit that such a change would occasion. Free competition, as the Act recognizes, is normally beneficial. It is not necessarily so. nor in any assumed amount. The various automotive divisions of General Motors seem to do very well. More close to home. the Massachusetts Department of Public Utilities, which voices no apparent criticism of a number of combined local gas and electric companies within the Commonwealth, affirmatively appeared in opposition to the Commission's proceeding in the present case. The Commission states that the Department's views have been "carefully considered." but it goes no further. If the Commission is of opinion that substantial gains will accrue to the gas system by placing it in competition with the electric companies rather than, in part, under the same roof. specific findings should be made, and not just a general reference to the advantages of competition. This is particularly called for where the evidence shows that NEES has made a special effort to obtain for its gas system many of the benefits of independence.

1474 Decree will be entered vacating the order of the Commission and remanding for further action not inconsistent herewith.

APPENDIX

In the Commission's brief counsel argues that section 11(b) embodies a federal concern with use of the holding company form to combine a gas system with an electric system. There are several answers to this. In the first place, it is too specialized an approach. The meaning of this section and of subclauses (A), (B) and (C) must be the same whether the principal system and the additional systems are of like nature or are different. "Substantial economies," in other words, should have the same connotation in the one case as in the other.

Secondly, nowhere in the Act is there a condemnation of the retention of gas and electric systems, provided the tests contained in clauses (A), (B) and (C) are met. To the contrary, section 8 prohibits a holding company's acquisition of gas and electric utilities serving the same territory, where state law pro-

hibits combined gas and electric operations, without express approval of the state commission. If anything, this is a negative pregnant, as the Commission has recognized and the legislative history makes clear. See Northern States Power Co., 1954, 36 S.E.C. 1, 8; S. Rep. No. 621, 74th Cong., 1st Sess., 29–30; H.R. Rep. No. 1318, supra, at 14–15; Report of National Power Policy Committee, H.R. Doc. No. 137, 74th Cong., 1st Sess., 10 (1935), appended to S. Rep. No. 621, supra, at 59; Hearings Before House Committee on Interstate and Foreign Commerce on H.R. 5423, 74th Cong., 1st Sess., 330 (1935)

(statement of Rep. Rayburn). How far such an infer-75 ence may be carried in the light of the fact that section

10(c), which prescribes the standards for acquisitions, expressly incorporates the retention standards, and requires further that an acquisition tend toward the development of an integrated system, may be questioned. Cf. American Water Works & Elec. Co., 1937, 2 S.E.C. 972, 983 & n. 3; Columbia Gas & Elec. Corp., 1941, 8 S.E.C. 443, 462-63; American Gas & Elec. Co., 1946, 22 S.E.C. 808, 815. But at least we find neither there nor elsewhere in the Act a general policy of opposition to gas and electric company joinder.

Nor, if the matter could be thought to be illuminated by administrative practice, has the Commission previously made such an interpretation, nor does it now. In its opinion the Commission stated, "We do not take the view that the Act expresses a federal policy against combined gas and electric operations as such." Counsel's attempt to explain this away by saying the Commission's phrase "as such" meant simply that the Commission was disclaiming interest when the interstate holding company form was not employed, attributes to the Commission the banality that it was not claiming jurisdiction in those cases where obviously it does not have it. We believe the Commission was saying something more than this, and that counsel, in the brief, is merely seeking some new ground to support the Commission's result.

1476 In the United States Court of Appeals for the First Circuit

Judgment-June 4, 1965.

This cause came on to be heard upon petition to review and set aside an order of the Securities and Exchange Commission, and was argued by counsel.

Upon consideration whereof, It is now here ordered, adjudged and decreed as follows: The order of the Commission is vacated, and the case is remanded for further action not inconsistent with the opinion filed today.

By the Court:
